

Usability in Pervasive Systems

307CR INTERACTIVE PERVASIVE SYSTEMS

Usability introduction/recap

- ▶ The majority (if not all) of you have studied usability in some depth during your degree.
- ▶ What do you remember about it?
 - ▶ Looks at the user and how to design systems that are accessible and easy to interact with.
 - ▶ PACT analysis
 - ▶ User studies
 - ▶ Quantitative/Qualitative data
 - ▶ Heuristics and Principles

Pervasive systems recap

- ▶ What do we mean by “*pervasive systems*”?
- ▶ Why do we make pervasive systems?
- ▶ What do/don't we like about them?
- ▶ What requirements do pervasive systems have?
 - ▶ Phenomena | Sensing | Processing | Communication | Visualisation
- ▶ How could these requirements affect usability?

Why is usability important?

- ▶ Why is usability in general important? How does it inform design?
- ▶ Why might usability be particularly important in relation to pervasive systems?
 - ▶ What are pervasive systems designed for?
 - ▶ Where are they used?
 - ▶ What do they do?
 - ▶ Who uses them?
 - ▶ What range of interfaces do we have?

• • •

- ▶ Pervasive systems largely deal with the collection and visualisation of data.
 - ▶ Therefore the way in which this data is presented to the user is important.
- ▶ Passive / Active pervasive systems.
 - ▶ Do all pervasive systems need interfaces?
 - ▶ What about automated context-aware systems?

Heuristics

- ▶ Due to their practical nature, the majority of pervasive systems are designed using a heuristic approach.
 - ▶ Heuristic approach is highly focused on practical development
 - ▶ Does not necessarily mean it is the most efficient approach (but better than nothing!)

- ▶ Visibility of system status
- ▶ Match between system and the real world
- ▶ User control and freedom
- ▶ Consistency and standards
- ▶ Error prevention
- ▶ Recognition rather than recall
- ▶ Flexibility and efficiency of use
- ▶ Aesthetic and minimalist design
- ▶ Help users recognize, diagnose, and recover from errors
- ▶ Help and documentation

Jacob Neilson's 10 usability heuristics of interface design

- (Do these all apply to pervasive system design?)

Different types of interfaces

- ▶ Visual feedback of the system state and/or data values
 - ▶ E.g. This could be as simple as using LED's
- ▶ Sensory feedback
 - ▶ Utilising some form of sensory feedback mechanism to inform the user of change within the system.
 - ▶ E.g. Using vibration in wearable systems
 - ▶ E.g. Audio feedback

User vs phenomena driven design

- ▶ Pervasive systems are almost entirely built to purpose. Meaning they have a bespoke job to do (such as monitor state change in a pre-determined phenomena).
 - ▶ These systems are generally designed from the phenomena forwards.
 - ▶ Temp >> sensors >> processing >> communication >> visualisation >> user.
- ▶ User centred design focuses the development process on the user and their abilities/requirements. Helping to ensure a purposeful and functional system.
 - ▶ These systems are designed from the user backwards.
 - ▶ User >> Visualisation >> Communication >> Processing >> Sensors >> Temp

- 
- ▶ Our system and data can affect the user in a range of ways
 - ▶ How?
 - ▶ Sensors may only be able to provide a certain range of values
 - ▶ Data collection and processing times
 - ▶ Communication cost (in power) and frequency (time)
 - ▶ Format for data collected
 - ▶ Accuracy
 - ▶ Types of interfaces available

- 
- ▶ User requirements can affect our system on the lowest levels.
 - ▶ How?
 - ▶ How often does the user sensibly require state change notification?
 - ▶ What response time is considered acceptable?
 - ▶ What information does the user need?
 - ▶ Does the user need to interact with the system / phenomena?
 - ▶ Can the user interact with the system to alter conditions?

• • •

- ▶ How can these processes effect various aspects of the system?
- ▶ How do they effect different members of your team?
 - ▶ [TASK] What roles might you expect to have within a pervasive system team?
 - ▶ What would they be responsible for?
- ▶ How does the type/format of data collected impact our system interface?

Examples of different Pervasive Computing interfaces

Powerglove

UbiBag

Pervasive life

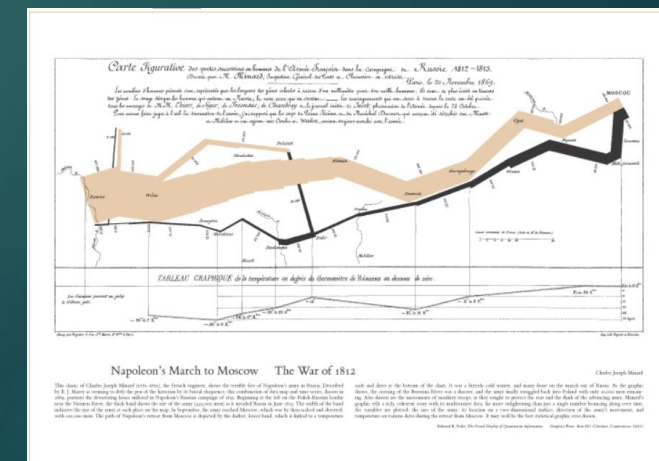

More examples

- ▶ You could also look at...
 - ▶ [Ring protect doorbell and security system](#)
 - ▶ [Microsoft HoloLens augmented reality](#)
- ▶ How do these systems work?
- ▶ How does the user interact with them?
- ▶ What kind of technologies are involved?

Visualising quantitative data.

- ▶ What link do pervasive systems have to quantitative data?
- ▶ Edward Tufte is considered one of the leading experts in the visualisation of data.
- ▶ Pervasive systems can potentially collect vast amounts of data, why is it important this is designed for?
 - ▶ What can we do about it?

Front end development

- ▶ How important is this for pervasive systems?
- ▶ Should you employ a dedicated front end designer/developer?
 - ▶ What are the advantages to this?
 - ▶ Why can't someone else in the team just 'bang something together'?
- ▶ Why is it important for front end developers to understand the rest of the system?

Cloud computing and social systems

- ▶ Given the large volume of data pervasive systems can collect, is it worth utilising cloud computing practices/technology?
- ▶ What are the advantages/disadvantages to implementing cloud computing within our pervasive system?
- ▶ Can we utilise our users (or their technology) to create ad-hoc pervasive systems that give low-level detail?
 - ▶ If yes, how?

• • •

- ▶ [Task] How can we utilise the technology commonly found on/around people to create a pervasive system?
 - ▶ This can make use of:
 - ▶ cloud computing principles
 - ▶ social media platforms
 - ▶ mobile technology

Summary

- ▶ Given that pervasive systems are designed to deliver data to an end user, it is important that we consider how best this can be achieved.
- ▶ Pervasive computing is highly technical and we often get caught up in a phenomena driver approach to designing new systems.
- ▶ Don't be afraid to focus on the user and hypothesise how the system will work at the beginning (although you'll need to make it eventually!).

...

- ▶ Get used to rapidly prototyping pervasive solutions. You won't need to implement them so use your imagination.
- ▶ Think about user requirements and how this impacts your system at the lowest levels.
 - ▶ Such as sampling rate (how quickly does your user really need data?)
- ▶ Being able to understand how the system works will alter your front-end design, so if you're not sure ask a team member.
